Asthma: Prevention and Treatment of Exacerbations
K. Dionne Posey, M.D., MPH, Gary Rosenberg, M.D., and Amy Pancake, RPh
December 2018

Objectives
At the end of this activity, participants should be able to:

• Explore clinical features, risk factors, and screening of asthma;

• Identify optimal preventive and treatment strategies to control asthma;

• Discuss the importance of a multidisciplinary approach when managing individuals with asthma;

• Discuss the pharmacologic and non-pharmacologic treatments for managing asthma; and

• Recognize the potential impact of behavioral health issues on individuals with asthma.
Agenda

• Definition
• Triggers
• Risk Factors
• Epidemiology
• Physiology
• Diagnosis
• Management
• Goals of Treatment
• Medication
• Behavioral Health Perspectives
• Case Management Opportunities

Asthma Definition and Snapshot

“Asthma is a common chronic disorder of the airways that is complex and characterized by variable and recurring symptoms: airflow obstruction, bronchial hyper-responsiveness, and an underlying inflammation.”

Asthma is a **chronic** inflammatory disease characterized by

- Symptoms of **cough, wheezing, dyspnea and chest tightness**
- Which are usually related to **specific triggering events**
- **Airway narrowing** that is partially or completely reversible
- Increased **airway responsiveness** to a variety of stimuli

NIH: www.nhlbi.nih.gov/files/docs/guidelines/03_sec2_def.pdf, definition of asthma, pp 12 and pp 1 - section 2
Asthma - Triggers

Triggers → are any substance or condition that causes inflammation in the airways and then potentially leads to asthma symptoms

- Physical Activities
- Weather – High humidity and extremes in hot/cold temperatures
- Infection – Upper respiratory tract infections, influenza, pneumonia
- Allergen – Pollen, mold, dust, pet dander or cockroaches
- Environmental factors – Such as air pollution or toxins, smoke, perfumes and aerosol/sprays
- Medications – Beta Blockers, Aspirins, NSAIDS, and ACE Inhibitors
- Emotional stress, depression and anxiety
- Comorbidities – Rhinosinusitis, gastroesophageal reflux, obesity, obstructive sleep apnea

Epidemiology and Burden of Illness

• Asthma is one of the most common chronic diseases worldwide with an estimated 300 million affected individuals (WHO 2016)

• Prevalence is increasing in many countries, especially in children

• Asthma is a major cause of school and work absence

• Health care expenditure on asthma is very high
  – Developed economies might expect to spend 1-2 percent of total health care expenditures on asthma (WHO 2016)
  – Developing economies are likely to face increased demands due to increasing prevalence of asthma
  – Poorly controlled asthma is expensive
  – However, investment in prevention medication is likely to yield cost savings in emergency care¹
  – U.S. Adults (2016 CDC) – 18 or > who currently have asthma: 20.4 million (8.3%)
  – U.S. Children (2016 CDC) – < 18 years who currently have asthma: 6.1 million (8.3%)²

Physiology (Inflammation and Broncho-constriction)

NIH: www.nhlbi.nih.gov/sites/default/files/inline-images/asthma%20diagram.jpg
Diagnosing Asthma

**Tools used in the diagnosis of asthma include:**
- History
- Physical examination
- Pulmonary function testing
- Other laboratory evaluations

**Physical examination in people with asthma**
- Often normal
- Most frequent finding is wheezing on auscultation, especially on forced expiration

**Wheezing is also found in other conditions; Examples:**
- Respiratory infections
- COPD
- Upper airway dysfunction
- Endobronchial obstruction
- Inhaled foreign body

Wheezing may be absent during severe asthma exacerbations (‘silent chest’)²

¹ UpToDate: [www.uptodate.com/contents/diagnosis-of-asthma-in-adolescents-and-adults?search=Diagnosis%20of%20asthma&source=search_result&selectedTitle=1~150&usage_type=default&display_rank=1](www.uptodate.com/contents/diagnosis-of-asthma-in-adolescents-and-adults?search=Diagnosis%20of%20asthma&source=search_result&selectedTitle=1~150&usage_type=default&display_rank=1), introduction

² GINA: 2017 Teaching Slide Deck, [ginasthma.org/ginasthma-teaching-slide-set/](ginasthma.org/ginasthma-teaching-slide-set/), slide 39

---

Diagnosing Asthma - Role of Evaluating Lung Function

**Diagnosis**
- Demonstrate variable expiratory airflow limitation
  - Reconsider diagnosis if symptoms and lung function are discordant
    - Frequent symptoms but normal forced expiratory volume (FEV₁);
      - cardiac disease
      - lack of fitness
    - Few symptoms but low FEV₁

**Risk Assessment**
- Low FEV₁ is an independent predictor of exacerbation risk

GINA: 2017 Teaching Slide Deck, [ginasthma.org/ginasthma-teaching-slide-set/](ginasthma.org/ginasthma-teaching-slide-set/), slide 47
Diagnosing Asthma - Spirometry

- **Preferred Tool** to use for diagnosing asthma
- **Technique**: A maximal inhalation is followed by a rapid and forceful complete exhalation into a spirometer with measurement of forced expiratory volume in one second (FEV₁) and forced vital capacity (FVC)
- Can usually be administered to children > 5 years that can follow directions

Recommended over peak flow for diagnostic purposes as peak flow meters are designed for monitoring asthma, not making diagnosis

Diagnosing Asthma - Typical Spirometric Tracings

![Spirometric Tracings](GINA: 2017 Teaching Slide Deck, ginasthma.org/gina-teaching-slide-set/, slide 38)
Additional Diagnosing Studies

- Pulmonary Function Tests: diffusing capacity:
  - Differentiates from COPD

- Broncho-provocation with methacholine:
  - Histamine, cold air, exercise

- Chest X-ray

- Allergy testing

- Biomarkers of inflammation:
  - Multi-allergen screen, Total Serum IgE, Allergen-specific IgE Antibody

- Blood tests:
  - A complete blood count (CBC) with differential
  - White blood cell analysis to screen for eosinophilia
  - Significant anemia

UpToDate: www.uptodate.com/contents/diagnosis-of-asthma-in-adolescents-and-adults?search=Diagnosing%20Asthma&source=search_result&selectedTitle=1~150&usage_type=default&display_rank=1

Diagnosing Classes

How?
Asthma severity is assessed retrospectively from the level of treatment required to control symptoms and exacerbations

When?
Assess asthma severity after patient has been on controller treatment for several months

Severity is not static – it may change over months or years, or as different treatments become available

GINA: 2017 Teaching Slide Deck, ginaasthma.org/gina-teaching-slide-set, slide 48
# Assessment of Asthma Control Questions

## A. Symptom control

<table>
<thead>
<tr>
<th>In the past 4 weeks, has the patient had:</th>
<th>Level of asthma symptom control</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Daytime asthma symptoms more than twice a week?</td>
<td>Well-controlled</td>
</tr>
<tr>
<td>• Any night waking due to asthma?</td>
<td></td>
</tr>
<tr>
<td>• Reliever needed for symptoms more than twice a week?</td>
<td></td>
</tr>
<tr>
<td>• Any activity limitation due to asthma?</td>
<td></td>
</tr>
</tbody>
</table>

Risk | Exacerbations | 0-1/year | > 2/year |

In general, more frequent and intense exacerbations (e.g. requiring urgent, unscheduled care, hospitalization, ICU admission) indicate poorer disease control
Management of Asthma – Management Goals

- The long-term goals of asthma management are:
  1. **Symptom control**: to achieve good control of symptoms and maintain normal activity levels
  2. **Risk reduction**: to minimize future risk of exacerbations, fixed airflow limitation and medication side-effects

- Achieving these goals requires a partnership between patient and their health care providers
  - Ask the patient about their own goals regarding their asthma
  - Good communication strategies are essential
  - Consider the health care system, medication availability, cultural and personal preferences and health literacy
  - Personalized written action plan

GINA: 2017 Teaching Slide Deck. ginasthma.org/ginasthma-teaching-slide-set/, slides 41 and 55

Asthma Action Plan

[Image of Asthma Action Plan]

Goals of Asthma Treatment

**Goals**

- Effective Asthma treatment
  - Avoid troublesome symptoms during the day and night
  - Need little or no reliever medication
  - Have productive, physically active lives
  - Have normal or near-normal lung function
  - Avoid serious asthma flare-ups (also called exacerbations, or severe attacks)

**Reduction of Impairment**

- Definition of “Impairment”
  - The degree to which an individual is limited by asthma exacerbations
  - Measured by intensity and frequency of asthma symptoms

**Strategies to Reduce Impairment**

- Prevent chronic symptoms
- Infrequent need for use of short acting beta agonist (SABA)
- Maintain normal activity level

---

1. GINA: 2017 Teaching Slide Deck, ginasthma.org/gina-teaching-slide-set, slide 29
2. UpToDate: www.uptodate.com/contents/an-overview-of-asthma-management?search=Asthma&source=search_result&selectedTitle=1~150&usage_type=default&display_rank=1, goals of asthma treatment

---

Reduction of Risk

- **Definition of "risk"**
  - Encompasses the various adverse outcomes associated with asthma and its treatment

**Strategies to Reduce Risk**

- Prevent exacerbations
  - Reduce the likelihood of future asthma attack
- Minimize need for acute care
  - (ER visit or hospitalization)
- Compliance with treatment
  - Reduction of progressive decline in lung function
- Reduce medication side effects
  - (minimize adverse effects of therapy)

**Reduction of Triggers**

- Avoiding known triggers and substances that irritate airway
- Elimination of exposure to smoke in home
  - Smoking outdoors is not enough to reduce risk

---

1. UpToDate: www.uptodate.com/contents/an-overview-of-asthma-management?search=Asthma&source=search_result&selectedTitle=1~150&usage_type=default&display_rank=1, goals of asthma treatment
2. UpToDate: www.uptodate.com/contents/trigger-control-to-enhance-asthma-management?search=asthma%20triggers&source=search_result&selectedTitle=1~96&usage_type=default&display_rank=1, approach to the patient
Management of Asthma - Risk Factors for Poor Outcomes

Risk factors for exacerbations:
• Uncontrolled asthma symptoms

Additional risk factors, even if the patient has few symptoms:
• High short-acting beta2-agonist (SABA) use (≥3 canisters/year)
• Having ≥1 exacerbation in last 12 months
• Low FEV₁; higher bronchodilator reversibility
• Incorrect inhaler technique and/or poor adherence
• Smoking
• Obesity, chronic rhinosinusitis, pregnancy, blood eosinophilia
• Ever intubated for asthma

GINA: 2017 Teaching Slide Deck, ginasthma.org/gina-teaching-slide-set, slide 46

Goals of Asthma Treatment

Treating to control symptoms and minimize risk
• Establish a patient-doctor partnership

• Manage asthma in a continuous cycle:
  – Assess symptom control + risk factors
  – Adjust treatment (pharmacological and non-pharmacological)
  – Review the response

• Teach and reinforce essential skills
  – Inhaler skills
  – Adherence
  – Guided self-management education
    • Written asthma action plan
    • Self-monitoring
    • Regular medical review

GINA: 2017 Teaching Slide Deck, ginasthma.org/gina-teaching-slide-set, slide 58
Goals of Asthma Treatment

**Patient Education and Empowerment**

- Teaching the proper technique for inhaler use
- Reinforcing skills
- Ensuring the member has access to and knows how to use inhaler spacer
- Ensuring member knows how to use a peak flow meter and knows the significance of the readings

**Success in Asthma Treatment**

- Key factors in achieving and maintaining asthma control requires:
  - Providing appropriate medication
  - Addressing environmental factors that cause worsening symptoms
  - Patient education and empowerment - helping patients learn self-management skills
  - Monitoring over the long term to assess control and adjust therapy accordingly
  - Addressing psychological issues

Instructional Videos for Inhaler Devices

Specialist Referral

Indications to Refer to an Asthma Specialist:
Pulmonologist or Allergist

- Patient has had life-threatening asthma exacerbation
- Patient is not meeting the goals of asthma therapy after 3-6 months of treatment
- Patient is being considered for immunotherapy
- Patient requires higher intensity treatment
  - step 4 care or higher
- Patient has required
  - more than 2 bursts of oral steroids in 1 year or
  - has an exacerbation requiring hospitalization

Medication Management of Asthma – Step Therapy

When deciding medication therapy for asthma, a stepwise approach is considered.
- Assess
- Adjust
- Review

Medications are increased when asthma is not under control, and may be decreased when asthma is controlled to minimize side effects.

Medications used to treat asthma are categorized into one of two basic categories:
1. Long-term control medications
2. Quick relief medications
# Medication Management of Asthma – Quick Relief Treatment Medications

**Used to treat acute symptoms**

<table>
<thead>
<tr>
<th>SABA (short acting beta agonist – albuterol, levalbuterol, pirbuterol)</th>
<th>Anticholinergics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work quickly to alleviate acute asthma symptoms</td>
<td>Short acting anticholinergics may be added to SABA in moderate to severe exacerbations. (long acting anticholinergics are also available and will be discussed later)</td>
</tr>
<tr>
<td>Relaxes the smooth muscles of the airways</td>
<td>Inhibit cholinergic receptors to reduce vagal tone</td>
</tr>
<tr>
<td>Can be used to treat exercise induced bronchospasm</td>
<td></td>
</tr>
</tbody>
</table>

# Medication Management of Asthma – Long Term Treatment Medications

**Long Term Control Medications:** Used to maintain control of persistent asthma. This category includes: corticosteroids, LABAs, cromolyn, immunomodulators and leukotriene modifiers

<table>
<thead>
<tr>
<th>Corticosteroids (beclomethasone, budesonide, fluticasone, mometasone)</th>
<th>LABA (Long Acting Beta Agonist – formoterol, salmeterol)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Most potent and effective anti-inflammatory</td>
<td>The preferred adjunctive therapy to be combined with ICS</td>
</tr>
<tr>
<td>Inhaled corticosteroids (ICS) are used for long-term asthma control (beclomethasone, budesonide, fluticasone, mometasone)</td>
<td>Treatment for moderate to severe asthma</td>
</tr>
<tr>
<td>Administration technique overview</td>
<td></td>
</tr>
<tr>
<td>Oral corticosteroids are often used in short courses for exacerbations, and long-term in some cases of severe persistent asthma.</td>
<td></td>
</tr>
</tbody>
</table>
Medication Management of Asthma –
Long Term Treatment Medications

**Long Term Control Medications**: used to maintain control of persistent asthma. This category includes: corticosteroids, LABAs, cromolyn, immunomodulators, and leukotriene modifiers.

<table>
<thead>
<tr>
<th>Cromolyn</th>
<th>Immunomodulators (omalizumab, benralizumab)</th>
<th>Leukotriene Modifiers (montelukast)</th>
<th>Other</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternative for mild persistent asthma, not preferred</td>
<td>Used as adjunctive therapy in those &gt;12yr of age who have allergies + persistent asthma</td>
<td>Alternative therapy, for treatment of mild persistent asthma</td>
<td>theophylline and tiotropium</td>
</tr>
<tr>
<td>May be used as a preventative for uncontrolled exposure to allergen</td>
<td>For those &gt;12 years of age, leukotriene modifiers are not preferred over ICS + LABA</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Management of Asthma**

GINA 2017 Teaching Slide Deck, ginasthma.org/gina-teaching-slide-set, slide 22
Step Wise Approach > 12 years

**Step 1**
SABA PRN, Consider low dose ICS
SABA alone reserved for patients with infrequent symptoms <2x month and no risk factors for exacerbations

**Step 2**
Low-dose ICS (alternatives: LTRA, cromolyn, theophylline)

**Step 3**
Low-dose ICS + LABA (alternatives: medium-dose ICS + LABA OR low dose ICS + leukotriene or theophylline)

**Step 4**
Medium-dose ICS + LABA (alternatives: medium/high dose ICS + leukotriene, theophylline, tiotropium)

**Step 5**
High dose ICS + LABA AND consider add on treatments: omalizumab, benralizumab, tiotropium

**Step 6**
Consider adding oral corticosteroids AND consider omalizumab, benralizumab

Step Wise Approach for 5 - 11 years

**Step 1**
SABA as needed

**Step 2**
Low-dose ICS (alternative cromolyn, LTRA)

**Step 3**
Low-dose ICS + LABA OR LTRA

**Step 4**
Medium-dose ICS + LABA (alternative: medium-dose ICS + LTRA)

**Step 5**
High-dose ICS + LABA (alternative: high-dose ICS + LTRA)

**Step 6**
High-dose ICS + LABA + oral corticosteroids
Asthma and Mental Health

• Close to 50% of people with Asthma have significant symptoms of anxiety and depression
  – Depression increases the frequency of asthma attacks
  – Depression with asthma increases the frequency of physician visits, ER visits and hospitalization¹

• Evidence suggests that asthma may precede and predispose to anxiety and mood disorders

• Evidence also suggests that the presence of psychological and behavioral problems may precede and predispose to asthma².

¹ CDC: Public Health Research, Practice and Policy- volume 3: No.2 April 2006
² PCRJ: www.nature.com/articles/pcrj201158

Asthma and Mental Health

• Psychological factors play a primary role in daily asthma management
  – The patient’s acceptance of having the disorder
  – The impact on daily life
  – The subjective interpretation of the symptoms- self-reported symptoms poorly correlate with pulmonary function measures
  – The degree of therapeutic adherence can be influenced by psychological issues

Asthma Research and Practice: asthma.biomedcentral.com/track/pdf/10.1186/s13079-015-0007-1, introduction, pp 2 of 6
Asthma and Mental Health

• Suffering from a chronic disease like Asthma results in a chronic degree of stress that requires constant adaptation
  – Cognitive
  – Emotional
  – Behavioral
  – Social

• Developing a positive vision of the disease without minimizing the potential danger and using active cognitive strategies and flexible and diversified behaviors results in less psychological problems, a greater sense of personal control and better long term outcomes

• Those with ineffective coping strategies have difficult to treat asthma

Care Management of Asthma – Improving and Empowering Members

• Health literacy

• Information fatigue

• Strategies for reducing the impact of impaired health literacy
  – Prioritize information (most important to least important)
  – Speak slowly, avoid medical language, simplify numeric concepts
  – Use anecdotes, drawings, pictures, tables and graphs
  – Use the ‘teach-back’ method – ask patients to repeat instructions
  – Ask a second person to repeat the main messages
  – Pay attention to non-verbal communication
Care Management of Asthma –
Key Strategies to Facilitate Good Communication

• Improve communication skills
  – Friendly manner
  – Allow the patient to express their goals, beliefs and concerns
  – Empathy and reassurance
  – Encouragement and praise
  – Provide appropriate (personalized) information
  – Feedback and review

• Benefits include
  – Increased patient satisfaction
  – Better health outcomes
  – Reduced use of health care resources

GINA: 2017 Teaching Slide Deck, ginasthma.org/gina-teaching-slide-set/, slide 56

Care Management of Asthma - Opportunity for Education

Unique opportunity to teach and reinforce self-management at every point of contact

Basic facts about asthma
  ✓ The contrast between airways of a person who has and a person who does not have asthma
  ✓ The role of inflammation
  ✓ What happens to airways during an asthma attack

Roles of medications: Understanding the difference between
  ✓ Long-term control medications
  ✓ Quick relief medications

Patient skills: 5 major points
  1. How to use a written asthma action plan
  2. How to identify and avoid triggers
  3. How to self-monitor with peak flow meter or recognize early signs/symptoms
  4. How to use inhaler and spacer
  5. When to seek medical attention
### Care Management of Asthma - Assessment

1. **Asthma Control**
   - Assess symptom control over the last 4 weeks
   - Assess risk factors for poor outcomes

2. **Treatment Issues**
   - Check inhaler technique and adherence
   - Ask about side-effects
   - Does the patient have a written asthma action plan?
   - What are the patient's attitudes and goals for their asthma?

3. **Comorbidities**
   - Think of: rhinosinusitis, GERD, obesity, obstructive sleep apnea, depression, anxiety
   - These may contribute to symptoms and poor quality of life

---

**When Needed a Referral to a Medical Director for a Peer to Peer**

### Care Management of Asthma – Value Pillars

#### Right Care
- Ensuring Right Diagnosis
- Identifying and Reduction of Triggers
- Reduction of Risk
- Monitoring Symptoms
- Understanding and using Asthma Action Plan

#### Right Provider
- PCP
- Pulmonologist
- Allergist
- Behavioral Health

#### Right Medications
- LABA
- LAMA
- SABA
- Inhaled Corticosteroids (ICS)
- Combined Therapy
- Monitoring Side Effects

#### Right Lifestyle
- Limit Exposure to Environmental Triggers
- Eliminate Exposure to Cigarette Smoke
- Achieve and Maintain Healthy Weight
**Assessment of Asthma Control Questions Children ≤ 5 Years**

<table>
<thead>
<tr>
<th>A. Symptom control</th>
<th>Level of asthma symptom control</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>In the past 4 weeks, has the child had:</strong></td>
<td>Well-controlled</td>
</tr>
<tr>
<td>• Daytime asthma symptoms for more than few minutes, more than once/week?</td>
<td>Yes</td>
</tr>
<tr>
<td>• Any activity limitation due to asthma? (runs/plays less than other children, tires easily during walks/playing)</td>
<td>Yes</td>
</tr>
<tr>
<td>• Reliever needed* more than once a week?</td>
<td>Yes</td>
</tr>
<tr>
<td>• Any night waking or night coughing due to asthma?</td>
<td>Yes</td>
</tr>
</tbody>
</table>

<td>&gt;80%</td>
</tr>
</tbody>
</table>

**Risk**

- **Exacerbations requiring oral systemic glucocorticoids**
  - 0 to 1/year
  - ≥2/year (see footnote)
  - Consider severity and interval since last exacerbation
- **Treatment-related adverse effects**
  - Medication side effects can vary in intensity from none to very troublesome and worrisome. The level of intensity does not correlate to specific levels of control but should be considered in the overall assessment of risk.
